

Double the Number

Description:

Write a program that reads a single floating-point number from the input and prints that number multiplied by 2 to the output. Your program's output is considered correct if it is within a 0.01 margin of error from the expected result.

Input:

A single line containing a floating-point number n ($0 < n < 10000$).

Output:

Output the number n multiplied by 2. Your output is considered correct if it is within 0.01 of the product's actual value.

Sample Input:

2.5

Sample Output:

5.0
